## OUR MODELS

[Juliana Cold Frames](#) have many features incorporated as standard, found only as extras on many other models. There are plenty of models to choose from. Juliana probably has the widest range of greenhouses on the market with sizes ranging from 4'3" x 2'2" to 65' x 12'. These kits are mini-greenhouses designed for the cultivation of small plants and vegetables and are ideal for the protection of young plants and seedlings in early spring

[Halls](#) Cold Frame Kits and plastic glazed cold frames provide an economic alternative to the conventional glass models; they are easy to relocate as the garden season changes and offer total safety to households with children.

Two models are available: Single cold frame, glazed with polypropylene, has 2 sliding and hinged vents and is supplied complete with anchor stakes. The double wide kits were introduced with the single cold frame as an economic and safe glazing option. The double cold frame features polypropylene glazing and is equipped with 4 sliding and hinged vents and anchor stakes.

[Farm Wholesale](#) provides you with lightweight, yet sturdy and easy to prop-up models for working under and adequate ventilation. Ample work space is available in the large-sized unit. When raised up on self-supporting legs, your 4' tomatoes can easily be protected from early frost.

Perfect for starting seedlings or holding off the winter frost a little longer, these kits give you all the benefits of greenhouses in

a portable, convenient unit. Larger than most - one unit is 8' long, 6' wide, and 34" high. This unit has ample storage space for those prized summer plants that you cannot bear to let wither away with the gray winter ahead. These kits use the same steel-reinforced PVC pipe and 3.5 mm double-walled corrugated plastic panels as the full sized greenhouses. The panels transmit 75% soft diffused light with a 2.5 R insulation factor.

---

Cold frames are bottomless boxes with a removable tops. They are used to protect small plants from wind and low temperatures. No artificial heat or manure is used inside a true cold frame, but many gardeners experiment with a variety of soil conditions. Utilizing the sun's heat, the soil inside the box is heated during the day and gives off its heat at night to keep the plants warm.

You can do many of the same things you do in a greenhouse. You can sow summer flowers and vegetables weeks before outdoor planting. Often, you will gain sufficient time to grow an extra crop. You can start vegetables, annual flowers for fall and winter, and perennials for next year's bloom. Plants are protected from harsh weather and will grow to transplant size quickly.
